

Reza Tabrizi

Full-Stack Developer — .NET & Vue

smr.tabrizi@gmail.com | +98 992 348 0125 | Tabriz, Iran (UTC+3:30, open to remote) | [linkedin.com/in/tabrizi-me](https://www.linkedin.com/in/tabrizi-me) | github.com/RezaTabrizii

SUMMARY

Full-stack developer with 3+ years building production platforms for international clients, from SQL Server and MongoDB data models and ASP.NET Core APIs to Vue/Nuxt interfaces. On the back end, cut API response times by up to 60% and built RBAC and real-time SignalR systems; on the front end, architected a Nuxt monorepo with shared components and Pinia stores powering 4 role-based dashboards, plus real-time proctored exams and SSR-optimized storefronts. Uses agentic AI tools throughout the development cycle, from planning to code review. Author of an open-source Vue component on npm.

TECHNICAL SKILLS

- **Languages:** C#, TypeScript, JavaScript, SQL, Python
- **Backend:** ASP.NET Core (MVC, Web API), Entity Framework Core, LINQ, SignalR, REST API design, JWT / ASP.NET Identity
- **Frontend:** Vue.js 3, Nuxt.js, Pinia, Vuetify, Tailwind CSS, SSR & technical SEO
- **Data:** SQL Server, MongoDB, Redis, query optimization & indexing
- **DevOps:** Docker, Docker Compose, Nginx (reverse proxy, SSL), S3, Sentry, GitLab CI/CD
- **Practices:** System design, SOLID, design patterns, clean architecture, Git, Agile/Scrum

WORK EXPERIENCE

Front-end Developer — ISBIS (*school admissions & online exam platform*)

Jul 2026 – Present · Beijing, China (Remote) · Nuxt.js, Vue 3, Vuetify, TypeScript · isbisapp.com

- Developed 4 role-based dashboards with distinct permission models for a portal serving students, parents, schools, and consultants, built in a single Nuxt.js monorepo sharing components, Pinia stores, types, and API clients across apps so each user type is onboarded without duplicating UI code
- Built a two-device proctored exam environment: candidates sit the exam on one device while a second device streams camera and room view to a live monitoring hub, with the exam auto-pausing the instant either device drops its connection
- Delivered the live invigilation dashboard on top of that hub, letting admins and school staff watch concurrent exam sessions in real time and disqualify candidates on the spot when cheating is observed
- Redesigned the school search and application flow around accessible, responsive components, cutting the application process from 5 steps to 3

Full-Stack Developer (Freelance) — Nira Gold Gallery (*solo side project alongside ISBIS · jewelry e-commerce*)

Jul 2026 – Sep 2026 · Tabriz, Iran · ASP.NET Core, Nuxt.js, Tailwind CSS · niragoldgallery.ir

- Designed, built, and deployed a complete e-commerce platform solo, including the database schema, .NET REST API, storefront, and a Vue admin panel that lets non-technical staff run the store. The MVP went live in 5 weeks
- Set up a GitLab CI/CD pipeline that builds and deploys the stack with Docker Compose on every merge, so releases ship without manual server work
- Implemented the checkout and payment flow with database-level concurrency controls, eliminating double-charge and oversell race conditions under concurrent orders
- Built a pixel-accurate Nuxt + Tailwind storefront from Figma designs and applied technical SEO (SSR, structured data, meta optimization) to drive organic search traffic

Back-end Developer — IKA (*enterprise inspection & contract ERP*)

Feb 2025 – May 2026 · Tehran, Iran (Remote) · ASP.NET Core, SignalR, SQL Server, MongoDB, S3, Sentry

- Architected the platform's backend, managing 200+ contracts across 80 active users, with 75GB of project files stored and served from S3
- Designed a role-based access control (RBAC) system with granular permissions across multiple user roles, making permissions simple to add or remove per role and automatically syncing every affected user's permissions whenever a role is updated
- Built real-time chat and live system notifications with SignalR Hubs, delivering 1,000+ messages/day to distributed inspection teams with persistent message history
- Cut API response times by 60% (from ~800ms to ~320ms) by profiling slow endpoints, rewriting N+1 queries, adding targeted indexes, and introducing in-memory caching for hot read paths
- Designed the data model and workflow engine for multi-stage inspection contracts, cutting processing time from ~2 hours to ~20 minutes per contract

Full-Stack Developer — NCT (*inspection management platform*)

Jan 2024 – Dec 2024 · Beijing, China (Remote) · C#/.NET, Vue.js, SQL Server · nctevo.com

- Built the platform from the ground up as part of a 6-person team, taking it from empty repo to production in 3 months
- Developed financial modules that track income and expenses, auto-calculate profit margins, and generate monthly reports, replacing ~20 hours/month of manual spreadsheet work
- Designed the REST API and relational schema backing the platform, supporting 460 users and 3,500+ inspection records

Sole Back-end Developer — Sino-UK (*school management platform*)

Nov 2022 – Dec 2023 · Beijing, China (Remote) · C#/.NET, Redis, SQL Server

- Built the end-to-end backend serving teachers and students, covering class scheduling, homework assignment and submission, progress reporting, and finance
- Implemented a constraint-based class scheduling algorithm using teacher availability, eliminating scheduling conflicts and ~6 hours/week of manual timetabling
- Designed and automated the financial subsystem for student and teacher accounts, plus an organization-wide financial and statistics dashboard, removing ~15 hours/month of manual accounting
- Cut response times by 55% (from ~600ms to ~270ms) on the platform's heaviest reporting and dashboard queries by introducing Redis caching

AI-ASSISTED DEVELOPMENT

- Work daily with Claude Code and other agentic coding assistants for implementation, refactoring, and code review, while owning the architecture and reviewing every AI-generated change before merge
- Used AI-assisted workflows to deliver ISBIS's 4 role-based dashboards and proctored exam system within 3 months of joining, while shipping a full e-commerce platform in parallel

PROJECTS

vue-jalali-datetime-picker — Open-Source npm Package

Vue.js, JavaScript, npm · GitHub · npm

- Authored and published an open-source Vue component for Jalali (Persian) calendar date/time selection, filling a gap in the Vue ecosystem for Persian-locale applications
- Made it fully customizable through themes, colors, formats, locale, range/time modes, and slot-based overrides, so consumers can restyle and extend every part without forking

EDUCATION

B.Sc. Computer Engineering — Payame Noor University of Tabriz · Sep 2022 – Expected Sep 2027

LANGUAGES

Persian (Native) • Turkish (Native) • English (Professional working proficiency)
